

[Shake Screen]

Function

Shakes the screen from left to right. Example situations in which this can be used to good effect would be representing earthquakes and taking damage.

Settings

- Under [Power], specify the strength of the shaking on a 9-level scale. The stronger the shaking, the greater the amount of movement. The level can be specified by dragging the slider.
- Under [Speed], specify the speed of the shaking on a 9-level scale. The faster the shaking, the less time it takes for the shaking to complete one cycle of movement. The level can be specified by dragging the slider.
- There are 2 methods for setting the shake duration, which can be selected using radio buttons.
 - When using [Shake duration], enter the duration of time (unit: 0.1 seconds) that the screen should continue shaking for. The range is 0~1000.
 - If [Start Shake] is selected, the flash will continue until the [End Shake] command is given. This makes it possible to carry out events while the screen is shaking.
 - [End Shake] finishes the shaking started with [Start Shake].
- If [Wait for Completion] is enabled under [Options], the player will not be able to move until this command has finished processing.
