

# [Flash Event]

## Function

- Temporarily covers an event with a color and slowly returns it to normal. This gives the effect of a flashing light.

## Settings

- Under [Event], choose the character to flash from the dropdown menu. "This Event" refers to the last map event on the call stack.
- Define the [Flash color] using the 4 components [Red (R)], [Green (G)], [Blue (B)] and [Value (V)].
  - The range of possible values is 0~31 (32 levels).
  - To specify their values, either drag their respective sliders, or directly enter the values.
  - The final color will be displayed under [Sample].
- Under [Flash duration], enter the duration of time (unit: 0.1 seconds) that should pass between the color flash and when the character returns to its original colors. The range is 0~1000.
- If [Wait until flashing is complete] is enabled under [Options], the player will not be able to move until this command has finished processing.

## Notes

- [Value] determines how strong the flash is. The smaller the value, the less obvious the flash is, so setting it to the highest value of 31 is recommended.
