

[Change Tile]

Function

Temporarily change a map tile to another tile.

Settings

- The process is as follows.
 - Under [Layer], choose whether the type of tile to be changed is an upper layer tile or lower layer tile.
 - Under [Original Tile], specify the tile to change. When the [Settings] button is clicked, the [Tile] window will appear. Click the image to select the tile, and click [OK].
 - Under [New Tile], choose the tile to change the tile selected in [Original Tile] to. The selection method is the same as the previous.

Notes

- Tile changing will occur for all occurrences of the same tile on the map.
For situations such as opening doors and treasure chests where only a specific tile needs to be changed, create an event with that image instead and use event conditions to change it.
- The changed tiles will only remain in effect while the player is on the map. When the player moves to another map, the tiles will return to normal.
