

[Call Event]

Function

- Calls other common or map events and processes them.
- When the called event has finished processing, this event command finishes processing as well. Processing then moves on to the next event command.

Settings

- Specify the event to be called from the following methods.
 - **Common Events:**
Calls a common event. Specify the common event's name from the dropdown menu.
 - **Map event (Constant):**
Calls another map event. Choose the event's name and page number from the dropdown menus. "This Event" refers to the last map event on the call stack.
 - **Map event (Variable):**
Calls another map event using input from a value stored in a variable. Specify variables that contain the event ID number and page number respectively.
